AI Writing Self-Check

Sample document (made up for testing) · 2026-11-05 02:15 UTC

This is an estimate, not a Turnitin result, and your real Turnitin score may be different. A flag does not prove that AI was used, and a low score does not prove that a person wrote the text. This check was built and tested with Claude and cannot tell which AI tool was used, so it may miss some AI text, including text written by Claude.

44%

of your text looks AI-written.

Automatic check: 44%.
Claude reading the full text: 44%.

What to fix first

The reading review agreed with the pattern check. The flagged paragraphs drop the author's fieldwork voice and return to general claims about universities.

The biggest passages come first. If the first 2 stop being flagged, your score falls below 20%. If all 3 do, it falls to 0%.

Fix a passage by rewriting it yourself from your notes and sources, not by swapping words. A fix may not change your score on Turnitin or any other detector.

1. Fieldwork notes on recycling at my college

68 words · your score after fixing this and the passages above: 27%

> Moreover, effective recycling initiatives foster collaboration, responsibility, and awareness among students from diverse backgrounds.

Why it was flagged: This paragraph makes general claims about universities and never mentions the Block C counts that drive the rest of the report.

What to do:

- What did your own bin counts show about campaigns or data? Replace the general claim with that finding.
- Which university or study are you relying on here? Cite one you have read, or cut the claim.
- What would you tell Kak Lina or the contractor to do differently? Write that down in your own words first.

▶ Wording that triggered the automatic check

2. Fieldwork notes on recycling at my college

57 words · your score after fixing this and the passages above: 13%

> In today's rapidly evolving world, sustainability plays a pivotal role in shaping the landscape of higher education.

Why it was flagged: The opening sets out a world-scale framing that the fieldwork does not need, and the voice shifts sharply from the paragraph before it.

What to do:

- Start from the moment your research question changed, then explain why it matters.
- Decide whether this paragraph is needed at all.

▶ Wording that triggered the automatic check

3. Fieldwork notes on recycling at my college

55 words · your score after fixing this and the passages above: 0%

> Additionally, a comprehensive strategy serves as a cornerstone of long-term success, ensuring that progress is sustained across the institution.

Why it was flagged: This closes on a broad promise without saying what your evidence supports.

What to do:

- State what five days of data can and cannot show.
- Say what you would change next semester and why.

▶ Wording that triggered the automatic check

Hidden tricks check

This looks for things that are often used to fool detectors.

Nothing found. There is no hidden text, no swapped letters and no leftover chatbot wording.

If you used AI in this work

- Check the rules from your university, supervisor or journal.
- Declare the AI use the way those rules ask, including the tool and what you used it for.
- Do not use a paraphrasing or “humaniser” tool. Turnitin looks for these, and using one can look worse than the original text.

If you did not use AI, but text was flagged

- Honest writing can be flagged, especially formal writing and writing by non-native English speakers.
- Keep your drafts, version history, notes and data files as proof of how you worked.
- Turnitin says its score should not be the only basis for action against a student, so you can ask to explain your process.

Fieldwork notes on recycling at my college

I spent three weeks in September counting what went into the bins behind Block C, because my supervisor said my proposal was too abstract. The first morning I got it wrong. I weighed the bags with the wet food still inside, so my plastic figure for that day (6.2 kg) is useless and I threw it out. After that Aiman helped me sort everything on a tarp before weighing.

Most of what we found was not what the posters warn about. Roughly 40% by weight was bubble tea cups with the liquid still in them, which the contractor told me they will not accept. I asked the cafe owner, Kak Lina, why she doesn't use a separate bin, and she laughed and said nobody had ever asked her to. That conversation changed my research question.

In today's rapidly evolving world, sustainability plays a pivotal role in shaping the landscape of higher education. As institutions navigate the complexities of waste management, stakeholders are increasingly recognizing the transformative potential of innovative recycling programmes. It is important to note that this shift is not merely an operational change but a fundamental reimagining of campus life.

Moreover, effective recycling initiatives foster collaboration, responsibility, and awareness among students from diverse backgrounds. By leveraging educational campaigns, universities can create engaging environments that cater to a wide range of learners, thereby enhancing environmental outcomes. Furthermore, the integration of data-driven systems offers valuable insights into waste streams, enabling administrators to provide timely and targeted interventions. This holistic approach underscores the importance of aligning policy with sound environmental principles.

Additionally, a comprehensive strategy serves as a cornerstone of long-term success, ensuring that progress is sustained across the institution. Such efforts not only strengthen institutional practice but also empower communities to adapt to changing needs. Ultimately, by fostering a culture of continuous improvement, universities can pave the way for a more sustainable and inclusive future.

Back at Block C, the numbers in week three surprised me. Once Kak Lina put out a bucket for leftover drinks, the contaminated share dropped from about 40% to 22%, though I only have five days of data and two of those were during a public holiday. I would not trust that figure yet. The contractor still rejected one load on 24 September because someone had dumped paint tins in the

bin, and I never found out who did it. Next semester I want to repeat the count with a proper control block.

How this score works

The score is the share of your checked words that were flagged. Like Turnitin, it counts full paragraphs and leaves out references, headings, lists, short table text and captions. Each document needs 300 to 30,000 checked words. An automatic check looks for common AI wording, then Claude reads the text for sudden changes in style. Neither has a measured accuracy rate, and neither compares your text with other sources, so this is not a plagiarism check.
